

ABSTRACT OF THE DISCLOSURE

A carpenter's layout tool has various measurements thereon, which measurements are used during stud wall construction. The tool has a pair of feet, each with a centrally disposed opening, 5 the feet being joined at a lower surface of each by a connecting bar. The connecting bar has measurements, both left justified and right justified, for joining corner marks, corner marks, and intersecting wall marks, using either 2X4 or 2X6 inch construction. The tool is dimensioned so that the feet provide 10 stud spacing with one of the openings in the respective foot being used for measurement initialization.
